AB - J01160674 Material has coating layer composed of pigment and binder in an amt. of 0.5-8 g/m<sup>2</sup>, on base. Steadfast sizing degree of material is 1-15 sec., and pigment includes at least aluminium oxide particles and silicon-contg. pigment having 10-200 m<sup>2</sup>/g of specific surface area by BET method. Recording method comprises performing recording by making ink drops including water-soluble dye, attached to the material to be recorded.  
- USE/ADVANTAGE - Material has high absorbing property of water ink, so that attachment of ink onto finger, etc. can be prevented immediately after the attachment of ink onto the material. When material is used in ink-jet recording, the dot has real roundness, and high density. Generation of paper powder can be prevented, so that contamination of recording device and clogging of nozzle by ink can be prevented.(0/0)
